

18. Implement a simple FOPC parser for basic logical expressions using python program.

Code

```
expression = input("Enter expression (Example: Human(Socrates)): ")
```

```
if "(" in expression and ")" in expression:
```

```
    predicate = expression.split("(")[0]
```

```
    argument = expression.split("(")[1].replace(")", "")
```

```
    print("Predicate:", predicate)
```

```
    print("Argument:", argument)
```

```
else:
```

```
    print("Invalid Expression")
```

Sample Input

Human(Socrates)

Sample Output

Predicate: Human

Argument: Socrates
